

Google Earth

Learning Objectives

- Open Google Earth and navigate the interface
- Search for locations and explore them virtually
- Measure distances between two points

Engage (5-7 minutes)

Imagine you could fly like a bird and see your village from the sky, then zoom out to see all of Karnataka, India, and finally the whole Earth. Google Earth lets you do exactly that—explore our planet from your computer screen. Let us take this virtual flight today.

Explore (10-12 minutes)

Open Google Earth in the browser. Search for your school's location. Zoom in slowly until you can see the building. Now zoom out to see your village, then your district. Write down at what zoom level you can first see your village name. Explore three neighboring towns.

Explain (10-12 minutes)

Google Earth is a virtual globe program that shows satellite images of Earth. You can zoom from space to street level, search for any place, and even see 3D buildings. It uses satellite imagery, aerial photography, and GIS data to create this detailed view.

Elaborate (8-10 minutes)

Try measuring the distance from your school to the nearest railway station using the ruler tool. Compare it with the road distance you know. Explore famous landmarks like the India Gate or Mysore Palace. Write about what you discovered.

Evaluate (5-8 minutes)

Exit ticket: Demonstrate opening Google Earth and searching for “Bangalore.” Use the ruler tool to measure distance between two points. Write one thing you learned about your area.
